

# Operators

## Operators in JavaScript

### Arithmetic Operators

Used for mathematical calculations.

```
let a = 10;  
let b = 20;  
  
let sum = a + b;  
let difference = a - b;  
let product = a * b;  
let quotient = a / b;  
let remainder = a % b; // Modulus  
let power = a ** b;
```

```
console.log(sum); // 30  
console.log(difference); // -10  
console.log(product); // 200  
console.log(quotient); // 0.5  
console.log(remainder); // 10  
console.log(power); // 100000
```

### Comparison Operators

Used to compare two values.

- `==` (Equal to) - Checks only data.
- `===` (Strict equal to) - Checks data and data type.

- `!=` (Not equal to).
- `>` (Greater than).
- `<` (Less than).
- `>=` (Greater than or equal to).
- `<=` (Less than or equal to).

```
let x = 10;
let y = 10;

console.log(x == y); // true
console.log(x === y); // true
console.log(x != y); // false
console.log(x > y); // false
console.log(x < y); // false
console.log(x >= y); // true
console.log(x <= y); // true
```

## Logical Operators

Used to combine multiple conditions.

Operator	Description	Example	Result
<code>&amp;&amp;</code>	Logical AND	<code>true &amp;&amp; false</code>	<code>false</code>
<code>  </code>	Logical OR	<code>true &amp;&amp; false</code>	<code>true</code>
<code>!</code>	Logical NOT	<code>!true</code>	<code>false</code>

```
console.log(true && false); // false
console.log(true || false); // true
console.log(!false); // true
```

## Bitwise Operators

### 1. Bitwise AND (`&`)

- Compares each bit of two numbers.
- The result is **1** if both bits are **1**; otherwise, it's **0**.

Truth Table "&"

INPUT		OUTPUT
X	Y	
0	0	0 - F
0	1	0
1	0	0
1	1	1 - T

$$X \& 0 = 0$$

$$X \& 1 = X$$

## 2. Bitwise OR (**|**)

- Compares each bit of two numbers.
- The result is **1** if at least one of the bits is **1**; otherwise, it's **0**.

Truth Table "|"

INPUT		OUTPUT
X	Y	
0	0	0 - F
0	1	1
1	0	1
1	1	1 - T

$$X \mid 0 = X$$

$$X \mid 1 = 1$$

### 3. Bitwise XOR ( ^ )

- Compares each bit of two numbers.
- The result is **1** if the bits are different; otherwise, it's **0**.

Truth Table "^"

INPUT		OUTPUT
X	Y	
0	0	0 - F
0	1	1 - T
1	0	1
1	1	0

SAME VALUE  $\rightarrow$  0  
 DIFFERENT VALUE  $\rightarrow$  1

$X \wedge 0 = X$   
 $X \wedge 1 = \sim X$   
 $X \wedge X = 0$

#### 4. Bitwise NOT (~) - Negation [ 1's compliment ]

- Inverts all bits (1 becomes 0, and 0 becomes 1).

Truth Table "~"

INPUT	OUTPUT
0	1
1	0

$$\sim 0 = 1$$

$$\sim 1 = 0$$

## 5. Left Shift ( << )

- Shifts bits to the left, filling with zeros on the right.
- $x \ll n$  multiplies  $x$  by  $2^n$ .
- Example:

$$0101 \ll 1 = 1010$$

						$n \ll 4$
$n=1$	1	0000	0001			
2		0000	0010			$n \ll 1 \Rightarrow 2n$
4		0000	0100			
8		0000	1000			$1 \ll n \Rightarrow 2^n$
16		0001	0000			

## 6. Right Shift ( >> )

**New bits are always is independent of msb**

- Shifts bits to the right, filling with zeros (logical shift) or the sign bit (arithmetic shift).
- `x >> n` divides x by  $2^n$ .
- Example: `0101 >> 1 = 0010`

$x =$	0100	1101		$x \gg 2$
	0001	0011		
$y =$	1011	0101		$y \gg 2$
	1110	1101		

## Triple right shift ( >>> )

new bits are always 0  
it is independent of msb

$x =$     1 0 1 1 0 1 0 1  
          0 0 1 0 1 1 0 1

$x \ggg 2$
